

ProofRank

Public AI product diligence for hackathon judges, sponsors, accelerators, and grant reviewers.

The product is not another submitted app. It is the evidence workbench a sponsor would use to decide which submitted apps are real.

Polished pitches hide weak evidence.

Judges need a fast way to separate working products from unsupported claims.

- **Broken or thin demos**
A good-looking page may not prove a working end-to-end workflow.
- **Sponsor logos without dependency**
Mentioning Bright Data is not the same as making live web evidence load-bearing.
- **Originality is hard to check**
The field already includes strong proof, video, compliance, and agentic web entries.
- **Review output needs receipts**
Sponsors need cited evidence, uncertainty, trace state, and recommended action.

Decision output

**Shortlist, verify live,
request proof, or hold.**

Every score opens into evidence.

The app makes the review chain visible instead of hiding it behind a single AI verdict.

The sponsor tool is the acquisition layer.

Bright Data is where live public evidence enters the workflow, not a badge in the footer.

- **Event intake**
/api/review-event fetches the field and marks intake traces as non-scoring provenance.
- **Project review**
/api/review-project checks repos, demos, package manifests, license, commits, and secret-risk signals.
- **Prior-art radar**
search_engine and discover queries are prepared for overlap and copied-claim review.
- **Trace discipline**
Only provider=bright-data and traceStatus=executed closes sponsor-fit proof.

Close open disputes, then export the proof receipt and final packet.

Bright Data sponsor Judge 85
Bright Data appears load-bearing, visible, and sponsor-relevant.
• Agentic Bright Data role is visible.
• Remote MCP, SERP API, Web Scraper API, CLI are referenced.
• Output is framed as a proof receipt rather than a generic summary.

Skeptical hackathon Judge 100
Eligibility concerns are mostly answered by public evidence.
• Public demo and workflow evidence are present.
• native.builder usage is explained.
• Event-window commits are visible.

Business buyer 100
The workflow maps to a real buyer with repeatable review pain.
• Target user is explicit.
• Manual review pain is clear.
• Workflow can be repeated across many submissions.

Originality radar
Defensible wedge / 96

Defensible wedge
Turns judging into proof receipts instead of one-shot summaries.
Combines claim ledger review with an adversarial tribunal.

Proof receipt
Save 250

Competition-aware design
The product is scoped to public submission verification judge and sponsor workflow with obvious Bright Data dependence.
design 93% confidence Codex design agent

Bright Data trace model
Live mode maps event and project URLs into Remote M SERP, Web Scraper API, and CLI collection steps.
adapter 86% confidence Bright Data adapter

Tool	Run	Query or URL	Flow	Status
Remote MCP	planned	https://lablab.ai/ai-hackathons/native-builder-build-without-limits	0	scoped to native builder live mode
SERP API	planned	exact project title and team similarity checks	0	scoped to original audit

Live collection plan
Demo mode mirrors these collection steps.

search_engine
Discover public mentions and possible duplicates

scrape_ex_markdown
Fetch submission page as judge-readable evidence

scrape_ex_markdown
Inspect public demo surface

search_engine
Check sponsor usage claims against public artifacts

The app now argues with itself.

That is the differentiator: ProofRank surfaces the objections a sponsor judge would raise.

- **Adversarial Tribunal**
Three lenses: Bright Data sponsor, skeptical hackathon judge, and business buyer.
- **Originality Radar**
Similar-project overlap with defensible-wedge bullets and live prior-art queries.
- **Honest blockers**
A missing native.builder URL or failed Bright Data token stays visible in the receipt.

The fallback is ready. The final proof is account-gated.

This is deliberately transparent so the submission does not overclaim.

Item	Status	Evidence
Fallback app	Ready	GitHub Pages deploy is green.
Demo video	Ready	Release MP4 refreshed to current UI.
Bright Data execution	Blocked	Current token returns HTTP 401.
Native.builder URL	Blocked	Requires team-owner login and publish.

The product is stronger because it refuses to score planned Bright Data traces as executed proof.

Fund proof-based AI review.

The hackathon wedge is judge diligence. The broader product is sponsor, accelerator, grant, and procurement review.

Next live run

1. Fix Bright Data token
2. Publish native.builder URL
3. Run live event and project receipts
4. Submit with refreshed video

Prize fit

**Best Agentic Use of
Bright Data**
